

How do I add a custom event to a Service Provider?

[Laravel events](#) provide an observer implementation, allowing you to listen and observe for specific tasks happening in your application. Adding a custom event to a **ServiceProvider** means that the application will listen to it as soon as it occurs. In terms of choosing the right **ServiceProvider** for the job, it breaks down into two options: a Module **ServiceProvider**, or any of the Providers listed under **app/Providers** of our shop's root directory.

Event directory:

```
app/Events
```

Listener directory:

```
app/Listeners
```

The **ServiceProvider** class has a **\$listen** property, to which we simply add on the Event that we wish to add, alongside its listener.
