How do I inject a view into a backend admin slot?

Any view you wish to inject into a slot should be defined in a **Service Provider**.

If the code is unique to a particular store it could be placed in the boot method of the **AppServiceProvider**. If it is to be included as part of a module, then it can be added in the setup method of the module's **ServiceProvider**.

When registering the view to be injected into the slot, you must provide the slot name along with the view, for example:

```
<?php

namespace Acme\MyModule;

use Aero\Admin\AdminSlot;
use Aero\Common\Providers\ModuleServiceProvider;

class ServiceProvider extends ModuleServiceProvider
{
    public function setup(): void
    {
        AdminSlot::inject('catalog.product.edit.cards', 'my-module::admin-slot');
    }
}
```

For advanced cases where additional data needs to be passed into your view, a closure can be used. The closure receives a **$data**parameter that contains the current variables on the page.

```
AdminSlot::inject('catalog.product.edit.cards', function ($data) {
    // add custom variables to the $data array

    return view('my-module::admin-slot', $data);
});
```
