

How do I use the product picker in my custom module?

The Product Picker provides a modal that lets users select a single or many products/variants with quantities. Parts of the admin use this such as the Price Lists and Create Order form. Modules such as **aerocargo/upsells** also make use of the Product Picker.

You can use the `<product-picker></product-picker>` Vue component from any admin view inside of your module that extends the official admin layout (`admin::layouts.main`). When using the Product Picker you need to provide a url for the `get-products-url` prop (this value is usually always the `admin.catalog.products.picker` route) and you need to provide a slot for the button that will be used to open the picker.

```
@extends('admin::layouts.main')

@section('content')
    <h2>
        <a href="{{ route('admin.modules') }}" class="btn">@include('admin::icons.back')
        Back</a>
        <span class="ml-4">My Module</span>
    </h2>

    <div class="card">
        <product-picker v-slot="picker"
                        get-products-url="{{ route('admin.catalog.products.picker') }}"
                        <a href="#" @click.prevent="picker.open" class="btn">Add Product</a>
        </product-picker>
    </div>
@endsection
```
