What are the available props for the product picker?

Prop	Type	Description
get-products-url	String	This is the only required prop. This is the URL for the API to get the products from. It’s common to set this value to {{ route('admin.catalog.products.picker') }}.
image-url-prefix	String	This is the image factory prefix to use for the product image URLs. This is set by default to use {{ image_factory(60, 60)->contain() }}.
no-image-url	String	This is the image URL to use when a product doesn’t have an image. This is set by default to use {{ asset('modules/aerocommerce/admin/no-image.svg') }}.
action-name	String	This is the button text shown on the confirm button of the product picker modal (bottom right). This is set by default to “Add Products”.
clear-selected-after-emit	Boolean	
pick-product	Boolean	This is a boolean that defaults to false. When true, products will be allowed to be selected as well as variants.

Prop	Type	Description
product-only	Boolean	This is a boolean that defaults to false. When true, variants will not be listed and not selectable.
pick-only	Boolean	This is a boolean that defaults to false. When true, variants will not need to be in stock to be selectable.
needs-quantity	Boolean	This is a boolean that defaults to true. When false, a quantity will not be able to be set for the selected variants/products.
emit-image	Boolean	This is a boolean that defaults to false. When true, the products/variants image will be emitted when selected.
emit-sku	Boolean	This is a boolean that defaults to false. When true, the products/variants sku will be emitted when selected.
emit-model	Boolean	This is a boolean that defaults to false. When true, the products/variants model will be emitted when selected.
emit-name	Boolean	This is a boolean that defaults to false. When true, the products/variants name will be emitted when selected.
emit-price	Boolean	This is a boolean that defaults to false. When true, the products/variants price will be emitted when selected.

Example

You can make use of the props like you usually would with a Vue component

```
@extends('admin::layouts.main')

@section('content')
   <h2>
       <a href="{{ route('admin.modules') }}" class="btn">@include('admin::icons.back')
Back</a>
       <span class="ml-4">My Module</span>
```

```
    </h2>

    <div class="card">
        <product-picker v-slot="picker"
                        get-products-url="{{ route('admin.catalog.products.picker') }}"
                        :max-selection="5"
                        :pick-product="true"
                        :emit-name="true"
                        :emit-model="true"
                        :emit-sku="true">
            <a href="#" @click.prevent="picker.open" class="btn">Add Product</a>
        </product-picker>
    </div>
@endsection
```
