

How do I enable mail notifications for an event?

You can enable mail notifications for an event by registering it with the `\Aero\Events\ManagedHandler` listener:

```
class ServiceProvider extends \Aero\Common\Providers\ModuleServiceProvider
{
    protected $listen = [
        Acme::class => [
            \Aero\Events\ManagedHandler::class,
        ],
    ];
}
```

If you have implemented the `register` method of the service provider, ensure it calls `parent::register()` else the listeners will not fire.

Now your event class will be selectable when creating a Mail Notification in the Admin.
