Admin v1.2 Released

The main focus of 1.2 are the improvements to the mail notifications screens, where the team have worked on making it easier for retailers to know what variables are available to pop into their email templates (for example, knowing `{{ order.reference }}` is how to include the order reference in the order confirmation email). As well as this, the screens also no longer offer a weird multi-step create process. Instead now you can select the event the mail will send on and set the email content all in one!

Regex is super powerful, but to be honest nobody has a clue how to use it. For this reason, we've added a nice little help panel for the postcode regex inputs (found in the shipping methods and tax configuration screens). Just click the (i) next to the label to find out more.

For those retailers who have customers who are super keen to order from them...in bulk...we realised it's not ideal to see all items on each order. We recently rolled out a feature to hide these order items from the order screen. Today, we're bringing that feature to the customer's profile screen, so you can also hide the order items there too.

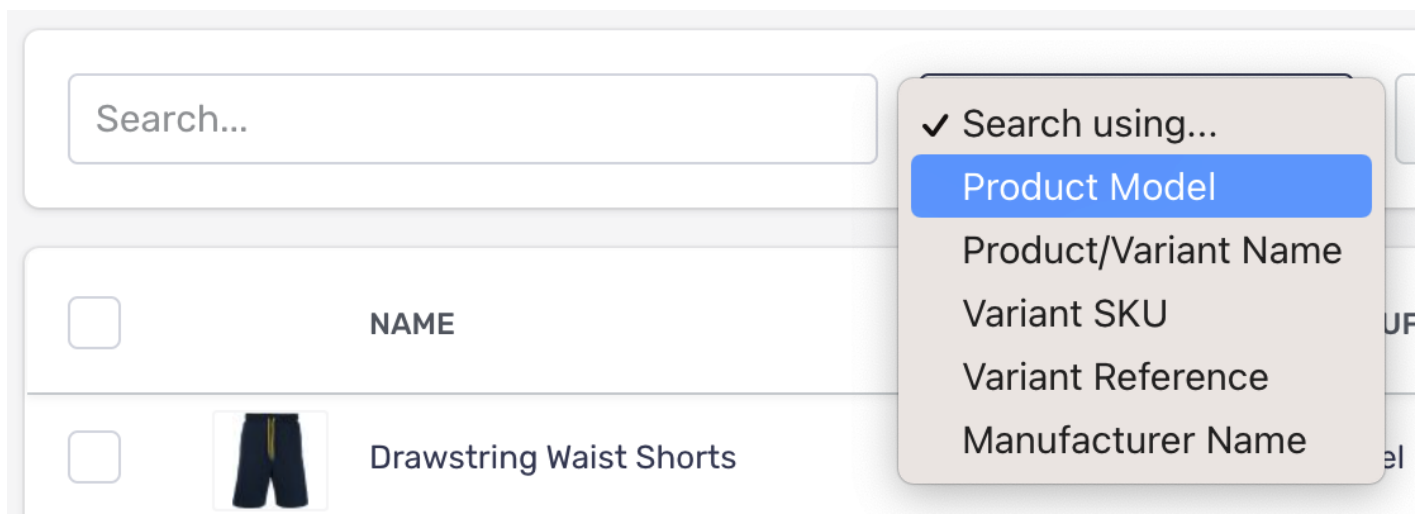

The release also includes several bug fixes and improvements (as you'd expect). Here are the release notes (apologies they are more developer based).

- [Added] Ability to toggle if order items show when viewing orders for a customer - [Added] Help sidebar panel for postcode regex - [Added] Support for array setting pre-defined options - [Added] Customer view page slots - [Added] Searchable select filter type - [Added] Improved mail notification screens - [Added] Ability to specify if a discount does not require a code - [Changed] Sticky table header - [Fixed] Price rounding issue when using 3d.p or more - [Fixed] Validation errors resulted in all checkboxes being selected when editing a product - [Fixed] Allow order per limit for buy x for y discount type

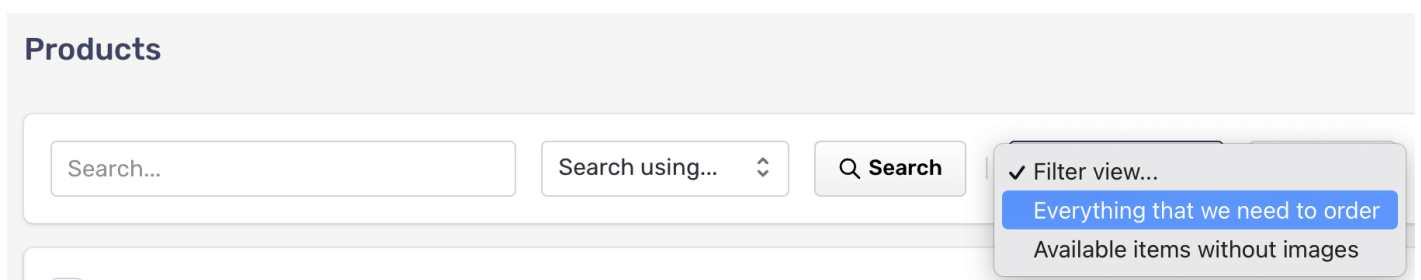

Admin v1.3 Released

It's been almost 2 weeks since the last admin release, and we're back with more features!

We've continued to improve the list views (we call these resource lists), and have added support for searching on specific columns. This offers several benefits, but the main ones are performance and accuracy. As with 99% of things we roll-out, this system can be extended so you can add your own "search fields" to scope the results.

As if this wasn't a great enough feature to throw into this minor release, we've also launched support for "saved filters". What are those I hear you ask? Well...imagine bookmarks but contextual and shared across your team. We call these "Saved Views" and they should really help on the order, product and customer lists (although they can be set on any list page). They're custom to you so can be tailored to those filters you use the most.

Another unsung hero we've managed to slip in is the ability to specify a central file driver for media uploaded to your store. This makes it super simple to shift assets and storage to S3 compatible services.

As always, we've thrown in a bunch of bug fixes and additions:

- [Added] Support for searching by specific columns in resource lists - [Added] Ability to save filters into views - [Added] Support for store based file driver - [Added] Slots for discount screens - [Added] Support for discount additional attributes - [Added] Support for

bulk actions to not be runnable (view only) and wide content mode - [Changed]
Permissions for returns - [Fixed] Mail BCC string issue - [Fixed] Issue with collection link -
[Fixed] Discount validation JS error for multi-codes - [Fixed] Subscription plan additional
attributes now save
